Innovation

Our technology approach does not just involve getting to know the latest trends, but also being part of them. We actively engage with the national and international start-up community through joint projects, mainly in blockchain and big data technologies.

Management

We are experienced in adopting and implementing different project management methodologies. We analyse business processes and diagnose transformation needs. Our main experience is based on PMO, BPM, agility and mobility projects.

Security

Our cutting-edge team specialises in global IT audit and cybersecurity solutions. We focus on people through training and practical exercises in cybersecurity, compliance and incident analysis.

Integration

Based on the appropriate knowledge and judgement, we help clients select and standardise their software tools. We identify the supplier's service model that best suits our client's operating needs. Our experience focuses mainly on ERP technologies (SAP, Odoo), content and document management (Alfresco, SharePoint) and CRM (MS Dynamics, Salesforce).

Consulting

We advise clients on how to best integrate IT tools with business processes. Our detailed research helps clients achieve the greatest results as swiftly as possible.

Technology

We identify the most appropriate IT model for our clients and help them implement it, offering our experts' know-how to make their projects viable.

Outsourcing

Our vast expertise and know-how in different industries enables us to help outsource key IT and strategic processes within your business, achieving both quick-wins and on-going best practices for your company.

Training

Training is a necessary and strategic component to learning about different IT developments, management methodologies, operational quality and regulations.

Blockchain & Distributed ledgers

Our multidisciplinary teams include IT, legal and finance experts and offer our clients unique know-how and experience. We facilitate the best use of this technology through business and technical workshops, analysing case studies and developing prototypes with measurable results.

Big Data & BI

We classify the different sources of information and integrate them in data lakes, identifying patterns and trends that enable us to better use information. We project the business' future development, enabling more efficient decision making.

PMO, BPM, ERP

By selecting the right business approach, we help transform processes and standardise business operations (new and existing). We ensure your EPR project is correctly implemented and appropriately managed, and that it delivers quick results.

Cybersecurity and IT audit

We carry out practical cybersecurity exercises which provide a unique learning experience. In terms of regulation, we have a diversified team of legal advisors and IT auditors who help clients comply with the different standards: ISO 27001, LOPD (on data protection), LSSICE (on e-commerce and information society services), LAECSP (on electronic access of citizens to public services).

Digital transformation & mobility

We help our clients define their digital transformation strategy and ensure it is achievable. Our model focuses on transforming a company's culture through mobility and security, supported by technology.

CRM, document management, ECM, CMS

We integrate our functional expertise with different CRM and ECM tools, creating a standardised solution adapted to your business requirements. Our functional and IT experience allows us to successfully manage integration projects.
